

I am a Bachelor of Computing student at Queen's University with a strong interest in software development, cybersecurity, artificial intelligence, and game development. I enjoy building projects that combine creativity and technical problem-solving, while continuously learning new technologies and improving my skills.

My experience ranges from technical projects and hackathons to leadership roles and professional work environments. During HackHer 2026, I collaborated with a team to develop a rule-based AI content detection tool using React and Python within a 24-hour hackathon setting. This experience strengthened my ability to work under pressure, solve problems efficiently, and contribute effectively within collaborative teams.

Outside of software development, I have worked in fast-paced customer service and manufacturing environments, including roles at Atlantic Superstore and Michelin. These experiences helped me develop strong communication skills, adaptability, attention to detail, and the ability to perform effectively in team-oriented settings.

I am also actively involved in leadership and community initiatives. As the Industry Outreach & Social Events Coordinator for COMPSA at Queen's University, I help organize networking opportunities and industry connections for computing students. I previously served as President of my high school cybersecurity team, mentoring peers and coordinating preparation for cybersecurity competitions.

I am passionate about technology, continuous learning, and creating meaningful experiences through software. My long-term interests include software engineering, cybersecurity, artificial intelligence, and eventually game development.
